

Assignment 6

Machine Learning, Summer term 2013, Ulrike von Luxburg

Solutions due by May 20

Exercise 1 (Play with SVM, 3 points) In this exercise, you would play with a Java implementation of SVM, which is available as an applet:
www.ml.inf.ethz.ch/education/lectures_and_seminars/annex_estat/Classifier/JSupportVectorApplet.html

Try to set the training points as depicted in Figure 1-a.

Figure 1: (a) Train data. (b) Train data with outlier.

Now train the SVM with the following settings. Capture the output screen for your report.

1. Linear kernel (Simple Dot Product) with $C = 100$.
2. Polynomial kernel of degree 2, and degree 8. Choose a proper C .
3. Gaussian kernel (Radial Basis Function): In the applet they use a different notation $\beta = 1/(2\sigma^2)$. Try $\beta = 0.01, 1, 10, 100$. Choose a proper C .

Now add noise to your training data as depicted in Figure 1-b. Try the Gaussian kernel with $\beta = 10$ and $C = 0, 10, 1000$. Based on your observation, describe the effect of the parameter C .

Exercise 2 (Understanding kernel SVM, 2 points) The output of kernel SVM in two problems with different parameters and kernels are depicted in Figure 2-a and 2-b. For each figure, answer the following questions:

- Which type of kernel is used: linear, polynomial or rbf?
- Argue if this is a good classifier? How we should change the parameters of the classifier to avoid this problem?

Can you guess the support vectors in Figure 2-a?

Exercise 3 (SVM in matrix form, 2 points) Write the primal and dual of SVM in matrix form. Use the symbol $\mathbf{1}_d$ to show the vector $[1, 1, \dots, 1]^T$ with length d . Note that for vectors $a, b \in \mathbb{R}^d$ and matrix X we have

$$a^T b = \sum_i a_i b_i \quad ; \quad a^T X b = \sum_{i,j} a_i b_j X_{i,j}$$
$$(X X^T)_{i,j} = \langle X_{i,*}, X_{*,j} \rangle.$$

Figure 2

Soft margin linear SVM: Primal

$$\begin{aligned} \min_{\mathbf{w}, \xi, b} \quad & \frac{1}{2} \|\mathbf{w}\|^2 + \frac{C}{n} \sum_{i=1}^n \xi_i \\ & y_i(\mathbf{w}^T \mathbf{x}_i + b) \geq 1 - \xi_i \quad i = 1, \dots, n \\ & \xi_i \geq 0 \quad i = 1, \dots, n \end{aligned}$$

Dual

$$\begin{aligned} \max_{\alpha} \quad & \sum_{i=1}^n \alpha_i - \frac{1}{2} \alpha^T \mathbf{K} \alpha \\ & \sum_{i=1}^n \alpha_i = 0 \\ & 0 \leq \alpha_i \leq \frac{C}{n} \quad i = 1, \dots, n \end{aligned}$$

Kernel SVM: Primal

$$\begin{aligned} \min_{\mathbf{w}, \xi, b} \quad & \frac{1}{2} \|\mathbf{w}\|^2 + \frac{C}{n} \sum_{i=1}^n \xi_i \\ & y_i(\mathbf{w}^T \Phi(\mathbf{x}_i) + b) \geq 1 - \xi_i \quad i = 1, \dots, n \\ & \xi_i \geq 0 \quad i = 1, \dots, n \end{aligned}$$

Dual

$$\begin{aligned} \max_{\alpha} \quad & \sum_{i=1}^n \alpha_i - \frac{1}{2} \alpha^T \mathbf{K} \alpha \\ & \sum_{i=1}^n \alpha_i = 0 \\ & 0 \leq \alpha_i \leq \frac{C}{n} \quad i = 1, \dots, n \end{aligned}$$

Exercise 4 (Building new kernels, 3 points) Assume that $K_1, K_2 : \mathcal{X} \times \mathcal{X} \rightarrow \mathbb{R}$ are kernel functions. Which of the following functions are also a valid kernel? Prove or bring a counterexample.

- $K = \alpha K_1$ for $\alpha > 0$
- $K = K_1 + K_2$
- $K = K_1 - K_2$
- $K(x, y) = K_1(x, y) \cdot K_2(x, y)$ (optional)
- $K(x, y) = f(x)K_1(x, y)f(y)$ for any function $f : \mathcal{X} \rightarrow \mathbb{R}$.

Exercise 5 (Polynomial kernel, 3 points) Consider the second degree polynomial kernel function $K(x, y) = (x^T y + 1)^2$ with inputs $x, y \in \mathbb{R}^2$.

- Show that the corresponding feature map function is $\Phi(x) = (1, \sqrt{2}x_1, \sqrt{2}x_2, x_1^2, x_2^2, \sqrt{2}x_1x_2)^T$ where $x = (x_1, x_2)^T \in \mathbb{R}^2$.
- If we use the second degree polynomial kernel for inputs from \mathbb{R}^d , what would be the dimensionality of the corresponding feature space?

Exercise 6 (MATLAB experiment, 6 points) In optimization using CVX, you can also access dual variables. For example in soft margin SVM

```
cvx_begin
    variables w(d) b xi(n)
    dual variable lambda
    minimize 1/2*sum(w.*w) + C/n*sum(xi)
```

```

lambda : Y.*(X*w + b) >= 1 - xi;
xi >= 0;
cvx_end

```

Use the following training data and set $C = 1$. Find the optimal primal w^* and the optimal dual variables λ^* .

```

X = [-3 3;-3 2;-2 3;-1 1;1 3;2 2;2 3;3 1];
Y = [-1 -1 -1 -1 1 1 1 1]';

```

1. From dual variable λ , find the support vectors (Support vectors are training points which the constraint is active on them: λ_i is larger than zero). Note that matlab is a numerical package, so in this example you can count values smaller than 10^{-6} as zero.
2. Check the KKT condition. To do this, you need to check that $\lambda_i^* (Y_i(w^{*T}X_i + b^*) - 1 + \xi_i^*)$ is zero ($< 10^{-6}$) for all i .

Here you have a CVX implementation of dual SVM with linear kernel $K(x, y) = x^T y$

```

K = X*X';
cvx_begin
    variables alpha(n) %you don't have anything with size d
    maximize( sum(alpha) - 0.5*quad_form(Y.*alpha,K) )
    alpha>=0;
    alpha<=C/n;
    alpha'*Y==0;
cvx_end

```

3. Verify that variables `lambda` and `alpha` are approximately equal.
4. Reconstruct the primal variables w and b from `alpha`, `X`, `Y`. Is the result is the same as the one you got from the primal?
